

1 **BioQueue: a novel pipeline framework to**
2 **accelerate bioinformatics analysis**

3 **Supplementary Information**

4 Li Yao^{1,*}, Heming Wang², Yuanyuan Song¹, Guangchao Sui^{1,*}

5 ¹College of Life Science, Northeast Forestry University, Harbin 150040, China, ²School of Life Science
6 and Technology, Shanghai Tech University, Shanghai 200031, China.

7
8 **Supplementary Note 1. The strategy to estimate the usage of memory.** According to
9 its implementation, BioQueue classifies the memory usage of a software into one of
10 two categories: input insensitive and input sensitive. For input insensitive software, it
11 will not store or just store a part of input data into memory, like HISAT2, to keep a
12 balance between speed and memory usage. The memory usage of a software can be
13 considered as a constant in some extent, so it can be estimated by calculating the
14 mean usage. For input sensitive software, which prefers to store all input data into
15 memory to achieve a high speed, the memory usage can be calculated by linear
16 regression using the size of input data as explanatory variable.

17 Prior to estimating the memory usage of a software, BioQueue calculates the size
18 of input data. During software execution, BioQueue monitors both physical and virtual
19 memories used by the software and saves the maximum usage separately. When
20 generating a model, BioQueue attempts to fit a linear regression model first; if the
21 correlation coefficient satisfies the threshold, BioQueue will predict the memory usage
22 by using this model. Otherwise, BioQueue will predict memory usage by calculating
23 the mean size of training data.

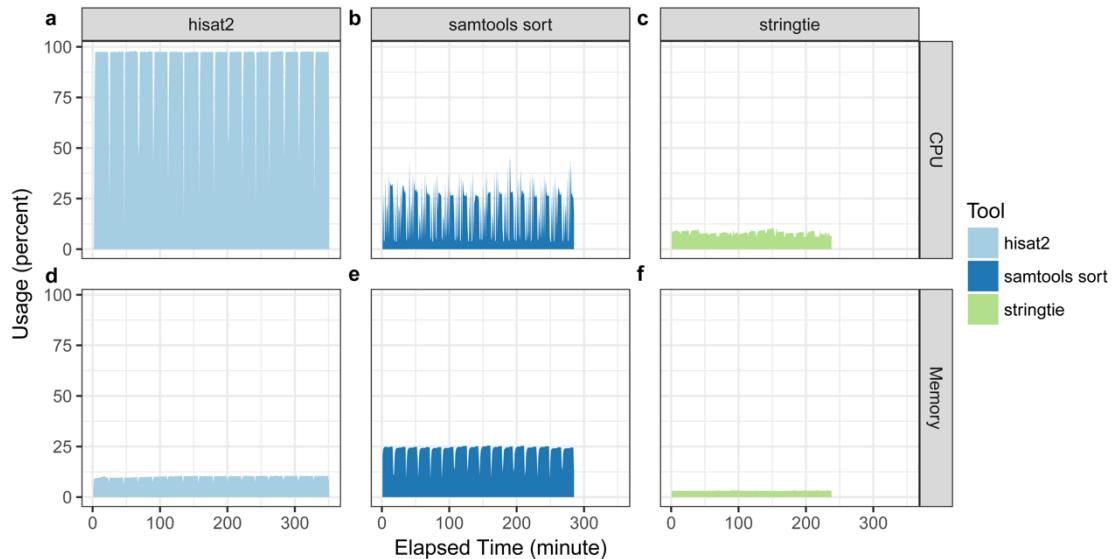

24 When BioQueue dispatches jobs alone, it will consider both physical and virtual
25 memory constraints. However, when BioQueue runs on clusters, though BioQueue will
26 provide predictions for both physical and virtual memory usage, the final
27 implementation will depend on the DRMs and operating system. For example,
28 TorquePBS allows BioQueue to provide guidance on allocating both physical and
29 virtual memories; however, for HTCondor 8.0+ on Linux distros, it only accepts the
30 expected maximum physical memory needed by a processed job.

31
32

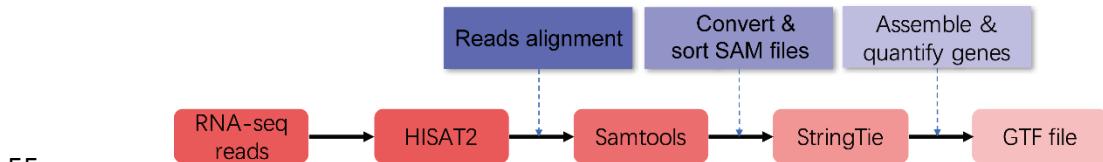

33 **Supplementary Note 2. Cluster plug-ins for BioQueue.** The support for clusters
34 depends on corresponding plug-ins. Each python file in the folder
35 “worker>>cluster_models” will be considered as a plug-in. BioQueue can directly
36 employ these plug-ins and users do not need to modify any code of BioQueue.
37 However, limited by the clusters accessible to us, BioQueue now just provides build-in
38 plug-ins for TorquePBS (already tested under production environment) and HTCondor
39 (only tested in virtual machines). Therefore, we expect our users who have the
40 privilege to access other types of DRMs can get involved in developing more cluster
41 plugins. We have provided a detailed guidance of developing new plug-ins for
42 BioQueue that is accessible at the documentation.

43

44

45
46 **Supplementary Fig. 1. The CPU and memory usage of three popular tools in**
47 **bioinformatics.** Each tool is specified to launch 16 parallel threads on a server with 16
48 cores/64 GB of RAM. When mapping reads, hisat2 can fully use the CPU resources (a),
49 but samtools (b) and stringtie (c) just use less than 50% of the CPU cores allotted to
50 them due to the implementation of the software and hardware limits (such as I/O
51 bottlenecks). In this case, the memory remains abundant (d-f). However, for some
52 memory-intensive tools (such as STAR), memory can be the bottleneck.
53
54

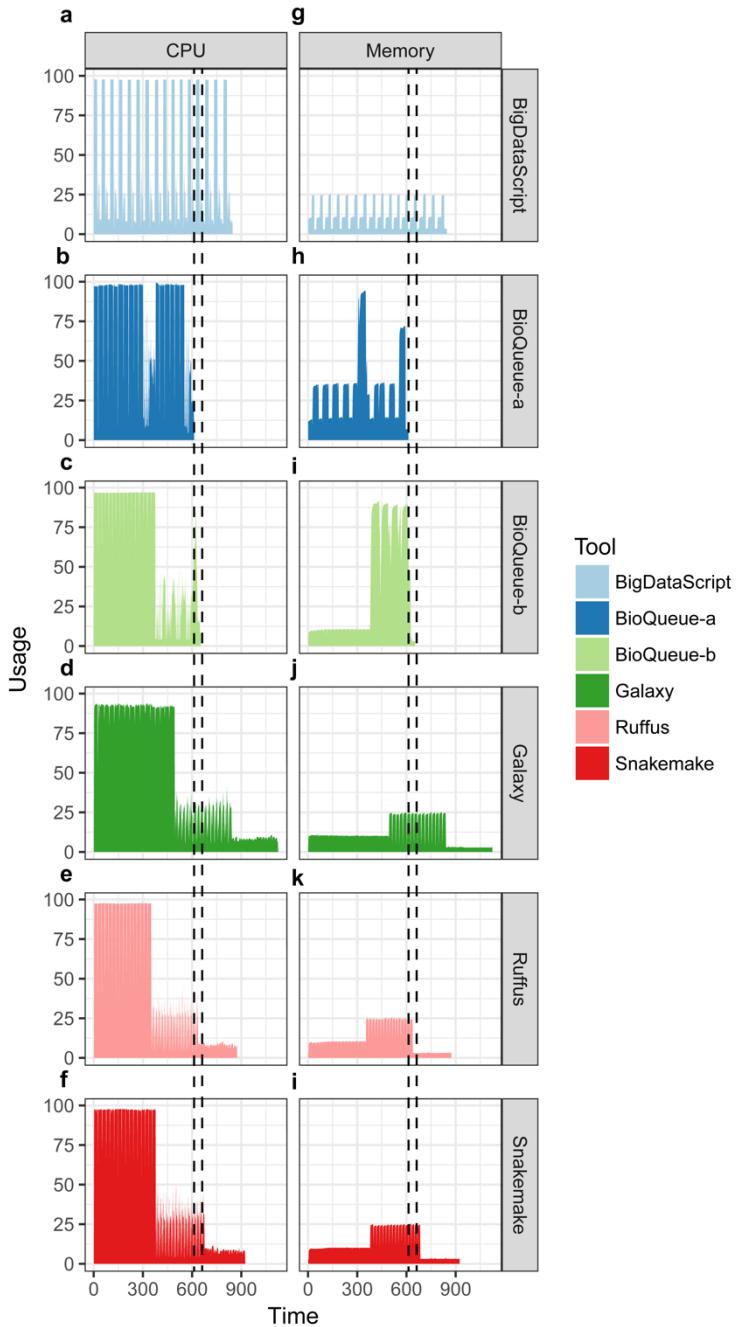

55

56 **Supplementary Fig. 2. Benchmark test of the protocol.** We used an actual biological
 57 data set, a previously published RNA-seq archive (E-MTAB-513) from the EBI
 58 ArrayExpress (<http://www.ebi.ac.uk/arrayexpress>), to run our test protocol, derived
 59 from the first three steps of a widely-used protocol (Pertea *et al.*, 2016). We performed
 60 a benchmark test on a server with 16 cores/64 GB of RAM following this protocol.
 61 Software enrolled in the benchmark are listed in Supplementary Table 1.

62

63

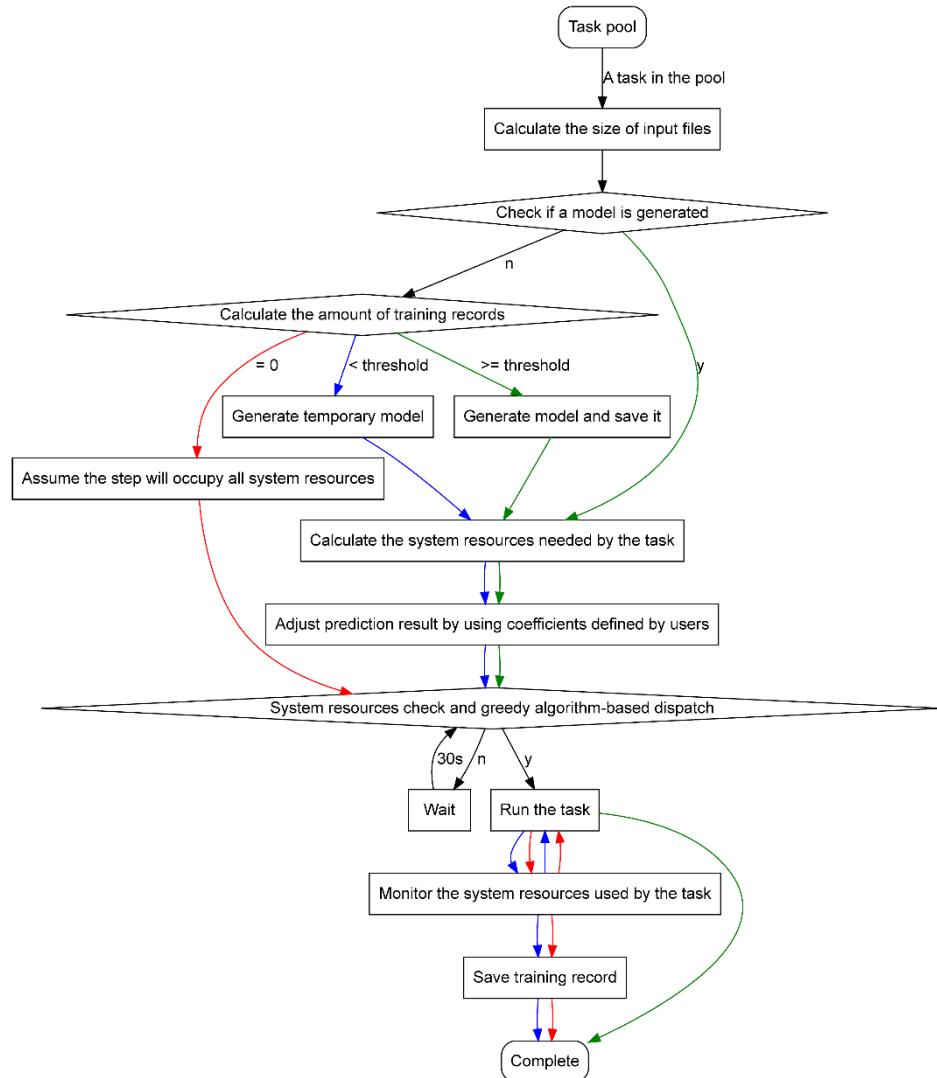

64

65 **Supplementary Fig. 3. CPU and memory usage in the benchmark test.** (a) to (f) The
 66 CPU cores used by these tools. (g) to (i) The memory used by these tools. In (b), (c), (h)
 67 and (i), the graphs show that BioQueue accelerates the whole process by making a
 68 more sufficient use of the computing resources than others. “BioQueue-a” denotes
 69 running BioQueue with a prediction model that is automatically imported from
 70 BioQueue Open Platform (<http://bioqueue.nefu.edu.cn>), while “BioQueue-b” denotes
 71 running BioQueue without a pre-existing prediction model. Under both circumstances,
 72 BioQueue can boost the processes.

73

74

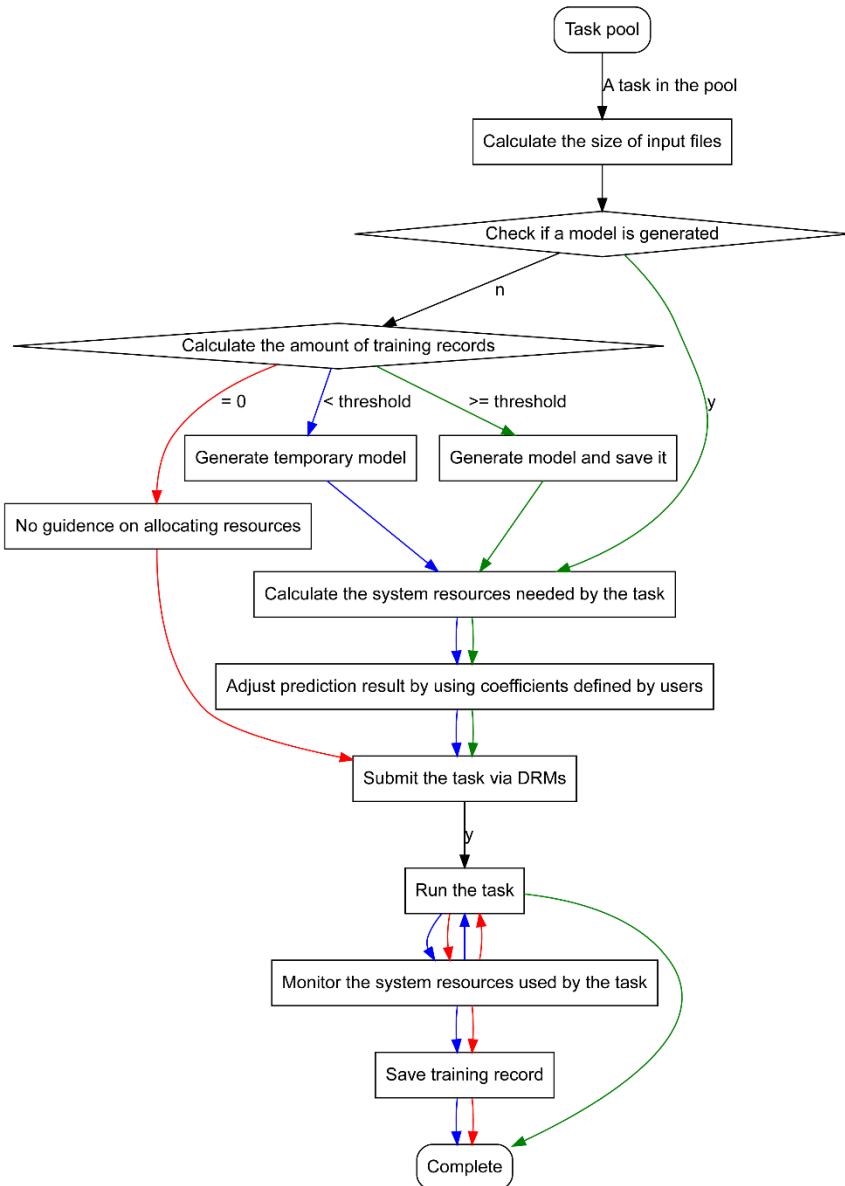

75

76 **Supplementary Fig. 4. The training-monitoring-estimation logic of BioQueue running**
 77 **in a local or cloud environment.** There are three circumstances for BioQueue: **(a)**
 78 when BioQueue runs a step without any previous experience (red lines), it assumes
 79 that the step will occupy all computing resources and starts a monitor process of
 80 detecting the system resources used by the task; **(b)** when BioQueue runs a step with
 81 limited experience insufficient to generate an optimal model (blue lines), it will also
 82 start the monitor process; **(c)** when BioQueue runs with a generated model (green
 83 lines), it will not start the monitor process. “threshold” in the graph means the
 84 minimum amount of training records to generate an optimal model.

85

86

87

88 **Supplementary Fig. 5. The training-monitoring-estimation logic of BioQueue running**
 89 **in a cluster.** Similar to the strategy depicted in Supplementary Fig. 4, there are the
 90 same three circumstances for BioQueue. However, when running in a cluster,
 91 BioQueue uses predicted resources to guide DRMs to allocate computing resources
 92 rather than dispatch jobs directly.

93

94

95 **Supplementary Table 1. Versions of software employed in the benchmark test of**
96 **Supplementary Fig. 2.**

97

Software	Version
hisat2	2.0.5
samtools	1.3.1
stringtie	1.3.3
BioQueue	1.0.0
BigDataScript	0.999
Galaxy	17.01
Ruffus	2.6.3
Snakemake	3.11.2

98

99

100 **Supplementary Table 2. Browser Compatibility of BioQueue workbench.** We carefully
101 tested BioQueue's workbench on all combinations (n=827) of operating systems and
102 browsers that we could access. The test proves that BioQueue is compatible to all
103 major browsers.
